

**High-quality
calcium-sodium
bentonite granulate**

Product Description

Aktivit is a bentonite granulate on calcium-sodium basis for beverage treatment. Permitted according to laws and regulations currently in force. Proved for purity and quality by specialized laboratories.

Aim of Treatment

Stabilization against protein and colloidal cloudiness. Clarification.

Product and Effect

Aktivit is a granulated pure bentonite with large surface for beverage technology. Aktivit provides for protein stabilization and clarification in all those cases where a pure calcium bentonite is not sufficiently efficient. Aktivit adsorbs certain protein substances, tannic and other disturbing substances, above all also in beverages with a relatively high pH-value or low acid content

Dosage

The exact dosage is best determined by pretest. For pure preventive treatment add approx. 70-150 g/100 litres. More if required.

Application

Prior to application, check prepared suspension for off-smell. Strew Aktivit slowly into an approx. 3-5-fold quantity of water under constant stirring. Allow to swell and settle for 4-8 hours, better for 12 hours. Pour off supernatant and liquefy the prepared Aktivit slurry with some of the beverage to treat. Then add the suspension to the vessel and mix thoroughly to provide for even distribution.

Storage

Aktivit is a highly efficient adsorbent, thus has to be protected from foreign smells and moisture. Store in a dry and well-ventilated place free from foreign odours. Reseal opened packagings immediately and tightly (airtight). For improper storage and application liability is excluded.
